Stone: From Technique to Technology

Part 3: The Impact of Geometry and Mathematics Renaissance, Enlightenment to Modern

Not all stone that is naturally occurring is great to build with and quarrying is difficult

How did inventions in mathematics impact the way that people "see" and represent in their "art"

How did that come to change the way we measure and are able to be more precise in our building methods.

Medieval representation: No ability to create "accurate" perspective
sacred geometry

The numbers which emerge from the 3, 4, 5
'Pychagorean' triangle provide beautiful symmetries for natural forms. This scries begins with a natural expression of the equilateral triangle and concludes with a serics of symmetries used as the inspiration for ground plans in Renaissance architecture.

## Pythagoras (590-470 BCE)

In antiquity, Pythagoras was credited with many mathematical and scientific discoveries, including the Pythagorean theorem, Pythagorean tuning, the five regular solids, the Theory of Proportions, the sphericity of the Earth, and the identity of the morning and evening stars as the planet Venus.

Golden ratio, also known as the golden section, golden mean, or divine proportion, in mathematics, the irrational number ( $1+$ Square root of $\sqrt{5}$ )/2, often denoted by the Greek letter $\phi$ or $\tau$, which is approximately equal to 1.618 .

It is the ratio of a line segment cut into two pieces of different lengths such that the ratio of the whole segment to that of the longer segment is equal to the ratio of the longer segment to the shorter segment.

The appearance of the
Fibonacci Series in the relationshups between the bonelengths of the human finger band and arm is another instance of the numerous $\phi$ relationships which occur in the human body

The Golden Divisions contained in the pentagram are shown to determine the proportions of this ancient mask of Hermes.

$$
\begin{aligned}
& \text { Let } A B C D E \text { be a reguvar peutagon. } \\
& \varphi=\frac{F D}{F E+F C}=\frac{F B+F A}{F D}=\text { golden ratio }=0.618033 \ldots \\
& \text { and } F D+F B+F A=F E+F C
\end{aligned}
$$

Leon Battista Alberti Italian Renaissance Architect 1404-1472

Because of the distortion of perspective inevit-
able in a photograph, we can only roughly indicate a few of the basic $\phi$ proportions. But this entire edifice is based on $\phi$ and $\sqrt{ } 2$
relationships.
